Only InterPro Domain and Repeat entries are drawn, and only those are compared — so every domain the events table names appears here. Neither drawn nor compared: InterPro Family and Homologous_superfamily entries, the residue features (active/binding/conserved site, PTM), and member-database signatures (G3DSA/PTHR/SSF/cd/PF), which are not curated structural units. FILLED = compared. HOLLOW = removed before the comparison, so no row of the events table can refer to it — an entry that duplicates a longer kept entry of the same accession overlapping it.

Diagram illustrating the domain architecture of the protein PIP-5K1A. The protein is shown as a linear sequence with various domains represented by colored blocks. A zoomed-in view of the C-terminal region shows a series of 186 amino acids, with a specific domain labeled IPR007110.
